1.1 Ordered Fields (Review)

Definition 1.1.1: Order

Let E be a set. An *order* on E is a relation $<$ on E such that for all $x, y, z \in E$:

1. (Trichotomy) Exactly one of the following holds: $x < y$, $x = y$, or $x > y$.
2. (Transitivity) If $x < y$ and $y < z$, then $x < z$.

Example 1.1.1 (Examples of Ordered Sets)

1. This definition develops orders on basic number systems: e.g. \mathbb{Z} , \mathbb{Q} , and \mathbb{R} .
2. Define \lesssim on \mathbb{Z} as follows: We say that $m \lesssim n$ for $m, n \in \mathbb{Z}$ if:
 - (a) m is even and n is odd
 - (b) m, n are even and $m < n$
 - (c) m, n are odd and $m < n$.

Key Concepts:

- upper/lower bounds of sets
- bounded sets
- max/min
- supremum/infimum
- supremum/infimum property: An ordered set E satisfies such a property if every nonempty set $A \subseteq E$ that's bounded above/below has a supremum/infimum in E .
- Fact: $\sup \text{ prop} \implies \inf \text{ prop}$

Definition 1.1.2: Ordered Field

Let \mathbb{F} be a field with order $<$. We say that \mathbb{F} is an *ordered field* provided that:

1. For all $x, y, z \in \mathbb{F}$, if $x < y$, then $x + z < y + z$.
2. For all $x, y \in \mathbb{F}$, if $0 < x$ and $0 < y$, then $0 < x \cdot y$.

Example 1.1.2

\mathbb{Q} is a field.

Facts of any ordered field:

1. $0 < 1$
2. $\nexists x \in \mathbb{F}$ such that $x^2 = -1$.

Definition 1.1.3: Ordered Subfield, Homomorphism, Isomorphism

Let \mathbb{F} be an ordered field.

1. A set $\mathbb{K} \subseteq \mathbb{F}$ is called an *ordered subfield* if \mathbb{K} is an algebraic subfield and \mathbb{K} is an ordered field equipped with $<$ from \mathbb{F} .
2. Let \mathbb{G} be an ordered field and let $f : \mathbb{F} \rightarrow \mathbb{G}$. We say that f is an *ordered field homomorphism* if it's a field homomorphism and $f(x) < f(y)$ whenever $x < y$.
3. f is an *ordered field isomorphism* if f is an ordered field homomorphism and f is bijective.

Note:

1. If $f : \mathbb{F} \rightarrow \mathbb{G}$ is an ordered field homomorphism, $f(\mathbb{F})$ is an ordered subfield of \mathbb{G} .
2. OF property $\implies f$ is injective.
3. \therefore every ordered field homomorphism $f : \mathbb{F} \rightarrow \mathbb{G}$ is such that f induces a bijection $f : \mathbb{F} \rightarrow f(\mathbb{F}) \subseteq \mathbb{G}$.

Theorem 1.1.1 \mathbb{Q} is the smallest ordered field. More precisely, if \mathbb{F} is an ordered field, then there exists a canonical ordered field homomorphism $f : \mathbb{Q} \rightarrow \mathbb{F}$.

Upshot/notation abuse: We identify $f(\mathbb{Q}) = \mathbb{Q}$ to view $\mathbb{Q} \subseteq \mathbb{F}$. In turn, $\mathbb{N} \subset \mathbb{Z} \subset \mathbb{Q} \subseteq \mathbb{F}$.

1.2 Types of Ordered Fields

Definition 1.2.1: Archimedean, Dedekind complete

Let \mathbb{F} be an ordered field.

1. We say that \mathbb{F} is *Archimedean* if $\forall 0 < x \in \mathbb{F}, \exists n \in \mathbb{N}$ such that $n > x$.
2. We say that \mathbb{F} is *Dedekind complete* if it satisfies the supremum property.

Facts:

1. \mathbb{Q} is Archimedean.
2. If \mathbb{F} is Dedekind complete, then $\forall 0 < x \in \mathbb{F}$ and $\forall 0 < n \in \mathbb{N}$, $\exists! 0 < y \in \mathbb{F}$ such that $y^n = x$.
3. \mathbb{Q} is not Dedekind complete. ($\sqrt{2}$ is a counterexample.)
